SARPS (Standards & Recommended Practices)

ICAO Standard

- Any specification for physical characteristics, configuration, material, performance, personnel or procedure, the uniform application of which is recognized as necessary for the safety or regularity of international air navigation and to which contracting States will conform in accordance with the Convention; in the event of impossibility of compliance, notification to the Council is compulsory under Article 38.
- Currently 23 Standards for Emergency Planning and RFFS

SARPS (Standards & Recommended Practices)

ICAO Recommended Practice

- Any specification for physical characteristics, configuration, material, performance, personnel or procedure, the uniform application of which is recognized as desirable in the interest of safety, regularity or efficiency of international air navigation, and to which Contracting States will endeavour to conform in accordance with the Convention.
- Currently 39 Recommendations for Emergency Planning and RFFS
- Also Airport Services manual Part 1 Rescue and Fire Fighting

SARPs

- As part of the ICAO proposal a review of the SARPs was agreed at the Working Group in 2012
- The review proposed to reduce 63 SARPs to 25
- Guidance should be in the Airport Services Manual
- Proposal made to Aerodromes Panel Montreal, December 2012

ICAO Proposal

With an evolution of existing provisions in mind and taking account of the tasks involved and applicable risk, develop new performance-based provisions for the response to an emergency at or in the vicinity of an aerodrome or heliport, with regard to:

- > the type and frequency of operations, including rotorcraft and general aviation;
- the size, construction and use of the aircraft;
- > typical emergency response scenarios, including details addressing accidents occurring at specific locations such as on or near the extended runway centreline;
- the availability and suitability of emergency response resources when needed; and
- the development of risk and task analysis criteria and methodologies

On the basis of the above, develop generic procedures and/or guidance on the development of procedures for the emergency response at or in the vicinity of an aerodrome or heliport for incorporation in PANS-Aerodromes

- 6.1 The meeting considered 20 Discussion Papers (DPs) covering a wide range of emergency planning, rescue and fire fighting issues. Highlights of the DPs are the proposal on the RFFS response, the acceptance of CAFS, a proposal from IOAPA to exempt GA from RFF requirements and the updating of the Airport Services Manual.
- 6.2 Presentations were received from ACI, DFW airport and others on training, new technology and the ACI APEX aerodrome inspection programme.
- Work emanating from the WG is:
- Complete review of SARPS relating to RFF;
- RFF content for PANS-Aerodromes;
- Dangerous goods guidance for ASM;
- GA proposal, clarification and survey to be carried out;
- Aircraft crash charts to be put on ICAO web portal;
- Aircraft categories to be updated;
- Review of ASM Part 7
- 6.3 Much of the above work will be reported at the Aerodromes Panel working groups meeting December 2012, and confirmed at the 2013 RFFWG for approval.

Review SARP's Procedural Guidance

Procedures for Air Navigation Services are complementary to the Standards and Recommended Practices contained in the ICAO Annexes. The PANS specify, in greater detail than in the Standards and Recommended Practices, the actual procedures to be applied.

Phase 4 location for the accident

Phase 5
Combine accident with the aircraft

Phase 6 Facilitated Task and Resource Analysis

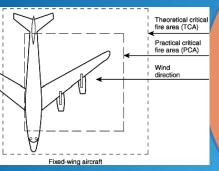

Emergency Response Scenarios

Example of Worst Case Credible Scenario

- Aircraft of highest RFFS Category
- Full passenger load
- 5% Dangerous cargo
- Engine fire on take-off
- Aborts take-off runs off end of runway into RESA
- Collapse of undercarriage
- Fire impinging on fuselage
- Evacuation takes place on unaffected side of aircraft
- Some passengers unable to self evacuate

Category Stage1 Stage2

Stage3

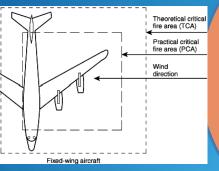

Planning

Initial Attack

Consolidation

Search And Rescue

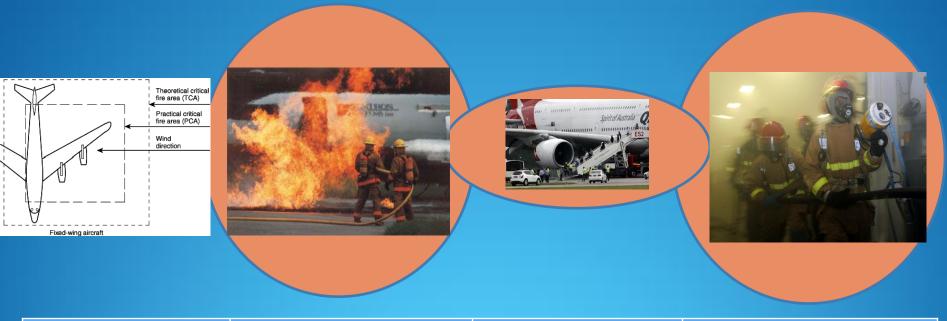

Category	Firefighters	Staff	Time

Category	Firefighters	Staff	Time
8	10	11 (5/6)	18

Response Index 8/10/11/18

Planning

The size (length and fuselage width) are used to categorise aircraft. The catgories 1 to 10 are then used to determine the amounts of fire fighting agents and number of vehicles to be provided.

The Response Index for planning is by aircraft category (size).

Initial Attack

A Task and Resource Analysis (TRA) is a process that should be followed to determine the appropriate number of competent fire fighting personnel to deliver an effective response. It uses a worst case credible scenario to identify tasks in real time before external services are able to effectively assist the RFFS.

The Response Index for Initial Attack is the number of fire fighters.

Consolidation

The Emergency Plan will include procedures and resources to secure and provide assistance e.g passenger evacuation mangement, access stairways, specialist advice. If an internal fire is within the fuselage this stage prepares for a fully resourced fire fighting and search and rescue operation to commence once external assistance arrives.

The Response Index for Consolidation is the number of staff (including any fire fighters able to assist)

Search and Rescue

Any occupants unable to make their escape without direct aid may require extricating from wreckage or rescueing from a fire within the fuselage. These operations will require external assistance as they can be protracted and resource intensive.

The Response Index for Search and Rescue is by minutes from notification to attendance of sufficient external resources to commence a fully resourced search and rescue or extrication operation.

EASA Proposed Rules

IR - ADR-OPS.B010 - Rescue and Fire-fighting Services

- (a) The aerodrome operator shall ensure that:
 - (1) aerodrome rescue and fire-fighting equipment and services are provided;
 - (2) adequate equipment, fire extinguishing agents and sufficient personnel are available in a timely manner;
 - (3) rescue and fire-fighting personnel are properly trained, equipped and qualified to operate in the aerodrome environment;
 - (4) rescue and fire-fighting personnel potentially required to act in aviation emergencies demonstrate their medical fitness to execute their functions satisfactorily, taking into account the type of activity.
- (b) The aerodrome operator shall implement and maintain training and check programmes to ensure the continuing competence of rescue and fire-fighting personnel.

EASA Proposed Implementing Rules

ADR.OR.D.005 — Management system

- (a) The aerodrome operator shall implement and maintain a management system that includes a safety management system.
- (b) The management system shall include:
 - (8) a safety training programme that ensures that personnel involved in the operation, rescue and fire-fighting, maintenance and management of the aerodrome are trained and competent to perform the safety management system duties;

- (c) In accordance with the relevant requirements of Part-ADR.OPS, the aerodrome operator shall ensure that:
 - (1) personnel involved in the operation, rescue and fire-fighting, maintenance and management of the aerodrome:
 - (i) are adequately trained in accordance with the training programme;
 - (ii) have demonstrated their capabilities in the performance of their assigned duties;
 - (iii) are aware of the rules and procedures relevant to the exercise of their duties; and their responsibilities and the relationship of their duties to the operation as a whole;

- (d) The aerodrome operator shall:
 - (1) maintain appropriate facilities, including office accommodation and working space, qualification, training and proficiency check records to demonstrate compliance with this requirement;
 - (2) on request, make such records available to its personnel concerned; and
 - (3) if a person is employed by another employer, on request, make such records of that person available to that new employer.
- (e) The training programme and the proficiency check programme shall require prior approval by the competent authority, as appropriate.

ADR.OR.D.035 — Record-keeping

- (a) The aerodrome operator shall establish an adequate system of record-keeping, covering all its activities undertaken under Regulation (EC) No 216/2008 and its Implementing Rules.
- (b) The format of the records shall be specified in the aerodrome manual.
- (c) Records shall be stored in a manner that ensures protection from damage, alteration and theft.
- (d) Records shall be kept for a minimum of 5 years, except that the below records shall be kept as follows:
 - (5) personnel training, qualifications, and medical records as well as their proficiency checks, until the as appropriate, for at least four years after the end of their employment, ..

EASA Proposed Rules

AMC6-ADR-OPS.B.010 — Personnel

- (a) The aerodrome operator should ensure that:
 - (1) During flight operations, sufficient trained personnel is detailed and readily available to ride the rescue and fire-fighting vehicles and to operate the equipment at maximum capacity;
 - (2) Personnel is deployed in a way that ensures the minimum response times can be achieved and continuous agent application at the appropriate rate can be fully maintained considering also the use of hand lines, ladders and other rescue and fire-fighting equipment normally associated with aircraft rescue and fire-fighting operations;
 - (3) All responding rescue and fire-fighting personnel are provided with protective clothing and respiratory equipment to enable them to perform their duties in an effective manner.

GM3-ADR-OPS.B.010 — Number of RFFS personnel

In determining the number of personnel required to provide for rescue, consideration is necessary to be given to the types of aircraft using the aerodrome. Staffing levels are promulgated, or reference to, the Aerodrome Manual.

What does ICAO require?

ICAO, Airport Services Manual, Part 1 – Rescue and Fire Fighting Chapter 2, Section 2.4

2.4 CRITICAL AREA

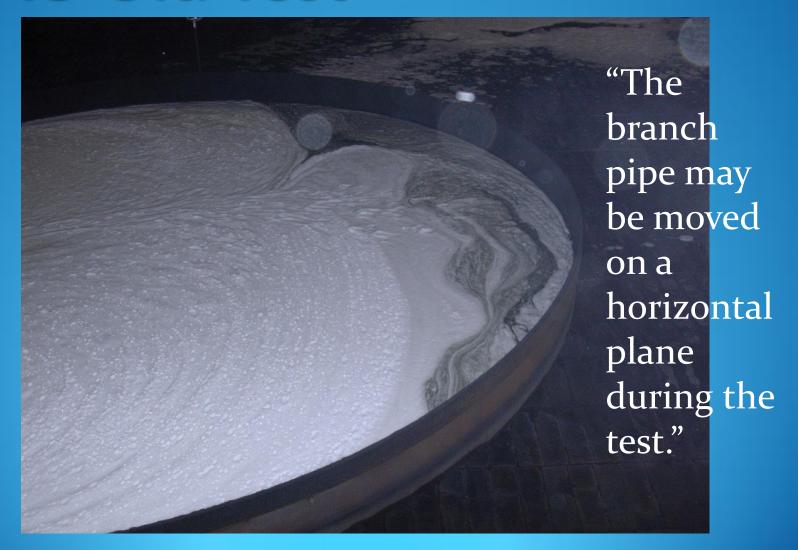

2.4.1 The critical area is a concept for rescue of the occupants of an aircraft. It differs from other concepts in that, instead of attempting to control and extinguish the entire fire, it seeks to control only that area of fire adjacent to the fuselage.

Critical Area

2.4.6 As mentioned earlier, in practice it is seldom that the entire theoretical critical area is subject to fire and a smaller area, for which it is proposed to provide fire fighting capacity, is referred to as the practical critical area.

Product fit for your purpose

Local environment

Regulators requirements

Company Policy

Equipment with foam

Replacement foams

Mutual aid

Initial

Whole life cost

Shelf life

Testing

Storage

Clean up

So why is it all so confusing?

- Different fires different fire fighting
- Different regulators different standards
- Different environments different dispersals
- Different equipment different compatibility
- Different costs you get what you pay for

But – whole life costs e.g. Cleanup can cost a lot more than the money you saved!

So how do we simplify the selection process?

- Select the appropriate standard
- Develop a suitable user trial does it do the job?
- Set your environmental requirements
- Does it work with
 - Existing equipment
 - New equipment
 - Existing foam
 - New foam
 - Mutual aid
- Ensure your decisions are based on potential whole life costs

Cost

Whole life

Management – storage and testing

The cost of water pollution:

- England and Wales £1.3 billion per annum
- USA \$4.3 billion per annum

Leeds Bradford Airport Fined £45K For De-Icer Pollution

Leeds Bradford International Airport has been fined a total of £45,000 after admitting releasing potentially harmful surface water into a nearby beck. The charges related to a period between October 2007 and March 2010, which saw a total of 23 breaches, and the company was ordered to pay £9,000 for each of the five charges.

A UK Water company was fined £15k for polluting a river, however, they also had to foot the bill for the following

Fine	+ £ 15,000
Tankering away the chemical	+ £ 32,600
Pluging the leak	+ £ 8,300
An initial fish survey	+ £ 6,000
Installing new equipment to detect a leak	+ £ 60,000
Charge for EA officers responding to the incident	+ £ 2,271
Further fish surveys and have put aside	+ £ 20,000
Restocking the stretch of river	+ £ 63,500
Prosecution costs.	+ £ 3,493

TOTAL £ 211,164

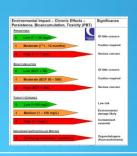

Environment

There is no defence for pollution

- Emergency use not the same as life safety
- Future regulations impact on non-hazardous pollutants see below
- Acute Chronic persistent accumulative !!
- Environmental Impact System

EU Water Framework Directive 2000/60/EC and the Groundwater Daughter Directive 2006/118/EC. The main impact of this is in GDD Article §6.1(b) where for non-hazardous pollutants Member States must take all measures "...necessary to limit inputs into groundwater so as to ensure such inputs do not cause deterioration or significant and sustained upward trends in the concentration of pollutants in groundwater..."

What effect does it have?

ScienceDaily (Jan. 24, 2012) — Elevated exposures in children to perfluorinated compounds, which are widely used in manufacturing and food packaging, were associated with lower antibody responses to routine childhood immunizations, according to a study in the January 25 issue of *JAMA*.

So why the confusion?

- Keep salesmen as the experts they know best
- Scaremongering to keep you locked into existing products
- To confuse on the environmental issues
- Numerous articles and presentations have been made around the world using a common script – someone is scared – WHY?

"Numerous formerly unacceptable quality foam concentrates could suddenly qualify as "acceptable" for use in the majority of airports globally. This could delay or prevent fire control and extinction in an emergency, while increasing the risk of unnecessary injury or death to casualties, passengers, crew, fire-fighters and other rescue personnel, without justification. Can this be right?" –IFJ, ?? 2012

Thank You

Simon Webb
